Employee Journey Map

Employee Raise Issue-Record Producer & Service Portal

Journey Map Analysis

1. Before Reporting :

The employee identifies a workplace or IT-related problem and needs a reliable way to communicate it. The main requirement is a **centralized and easy-to-understand reporting process**.

2. Accessing the Portal :

The employee accesses the Employee Center or Service Portal and looks for the option to raise an issue. A clear portal structure helps the employee reach the required form quickly.

3. Raising the Issue :

The employee opens the Raise Employee Issue form and enters the required information. The Record Producer provides a structured and guided way to submit the issue.

4. Categorizing the Issue :

The employee selects an appropriate Category and Subcategory. Dependent choices help display relevant subcategories according to the selected category, making the form easier to complete and improving data consistency. This matches the project design where dependent choices were identified as a core requirement.

5. Submission :

The employee completes the mandatory fields and submits the issue. UI Policies and Client Scripts can support field behavior and validation, helping reduce incomplete or incorrect information.

7. Resolution and Future Improvement :

The issue moves through the support process until it is addressed. Future enhancements can include notifications, automation, reports and dashboards, which were also identified as supporting enhancements in the project ideation.

Conclusion :

The Customer Journey Map shows how an employee moves from identifying a problem to submitting and tracking an issue in ServiceNow. The Employee Raise Issue project simplifies this journey by providing a centralized portal, guided Record Producer, structured fields, dependent choices, validation and centralized record management. This creates a more organized experience for employees while making issue management easier for administrators.
