Project Planning Phase

Planning Logic – Employee Raise Issue

The **Planning Logic** for the Employee Raise Issue project defines the systematic steps required to design, develop, test, and implement the solution in ServiceNow. The plan focuses on making the issue-raising process simple for employees and easy to manage for administrators.

Planning Logic:

1. **Identify the Problem**
   Understand the difficulties employees face while reporting workplace or IT-related issues, such as confusion, incomplete information, and difficulty tracking requests.
2. **Define Project Requirements**
   Identify the required fields, categories, subcategories, issue states, validations, and user roles needed for the application.
3. **Create the Data Structure**
   Create the Employee Raise Issue table and configure the required fields to store employee issue information in a structured manner.
4. **Develop the Record Producer**
   Create a Raise Employee Issue Record Producer that allows employees to submit their issues through a simple and guided form.
5. **Configure Form Logic**
   Implement mandatory fields, Category–Subcategory dependency, UI Policies, and Client Scripts to improve data accuracy and user experience.
6. **Integrate with Employee Center/Service Portal**
   Make the Record Producer accessible through the Employee Center/Service Portal so employees can easily find and use the issue-raising facility.
7. **Test the Solution**
   Test form submission, mandatory-field validation, category and subcategory selection, data creation, and different user scenarios to ensure the solution works correctly.
8. **Manage Submitted Issues**
   Provide administrators/support teams with centralized access to submitted issues so they can review, track, and manage employee concerns.
9. **Plan for Future Enhancement**
   The application can later be enhanced with automated notifications, workflows, approvals, SLA tracking, reports, dashboards, and integrations.

Expected Outcome:

The planning logic ensures that the Employee Raise Issue application is developed in a structured way and provides employees with a **simple, centralized, and user-friendly method to report issues**, while helping administrators manage those issues efficiently.
